

Abstract of the Disclosure

A fuser release agent dispensing system for a rotatable fuser, including a transfer stage and a metering stage. The transfer stage includes a first roller having a surface rotatable about a fixed axis, and a second roller  
5 positionable for contacting the first roller. The second roller is positionable against the fuser roller. The first roller is driven by the fuser roller and it, in turn, drives the second roller. The metering stage includes a sump for supplying release agent, a metering roller with a surface for removing release agent from the sump and a translational assembly configured to move the metering roller surface into  
10 and out of contact with the first roller surface. The amount of fluid release agent transferred from a sump to a fuser is controlled in response to a change in one or more image reproduction parameters.
